EDUCATION

Georgia Institute of Technology – Atlanta, GA *August 2024 - May 2026*
Master of Science, Computer Science
Relevant coursework (Ongoing): Computer Vision, Machine Learning, Graduate OS (Head TA)

Birla Institute of Technology & Science, Pilani – Goa, India *Aug 2017 - June 2021*
B.E.(Hons), Computer Science, GPA: 3.6/4 (top 10% of the class)
Relevant coursework: Deep Learning, Machine Learning, Artificial intelligence (A- grade, top 10% of the class), Data Structures & Algorithms, Operating Systems (A grade), Computer Programming (in top 7/850)

PUBLICATIONS

R. Dubey, V. Banerjee, S. Hounsinou, G. Bloom, *Strong APA scheduling in a real-time operating system: work-in-progress*, International Conference on Embedded Software (EMSOFT), 2021. [DOI], [Talk], [Poster]

EXPERIENCE

CERN (European Organization for Nuclear Research) – Geneva, Switzerland
Fellow *October 2022 – July 2024*

- Part of a 3-member team responsible for managing a distributed and redundant SCADA system called REMUS that manages **1000+** diverse sensors in accelerator, experimental, and surface areas at CERN.
- Researched and developed multi-threaded device drivers in C++ for REMUS and state-aware fault-tolerant networking programs for sensors with outdated OSes, enabling robust networking capabilities.

Oracle – Bangalore, India
Backed Software Engineer *July 2021 – September 2022*

- Implemented new features and fixed production bugs in a multi-tenant application, Oracle Process Automation, with a microservice architecture on Oracle Cloud.
- Wrote terraform code to create and manage the deployment of infrastructure required for the application on the cloud. Deployed these codes in a part of a 5-member team across **50+** OCI data centers worldwide.

Google – Remote
Summer of Code Student with RTEMS *May 2020 – Aug 2020*

- Contributed to RTEMS, a POSIX-compliant real-time operating system extensively utilised in various domains, including NASA/ESA satellites and particle accelerators across US DoE national labs.
- Implemented the Strong Arbitrary Processor Affinity (APA) scheduler, a state-of-the-art scheduler that had not been implemented in a real-world operating system.
- The Strong APA scheduler introduced the ability to dynamically relocate higher-priority tasks among processors, optimizing resource allocation by accommodating lower-priority tasks constrained by affinity requirements. The scheduler is proven to schedule roughly **20%** more task sets than other schedulers for certain utilization. Published a paper and wrote a blog on the implementation.

AWARDS

Merit-Need Scholarship — BITS Pilani *2017-2021*
Hercules Prize - edition 2019/2020 — University of Modena and Reggio Emilia, Italy *Feb 2021*
Google Summer of Code (GSoC) 2020 — Google *May 2020*

SKILLS

Programming Languages: C/C++/C++14, Python, Java, SQL
Languages: Fluent in English and Hindi, Conversational in French
Interests: Piano, Painting, Skateboarding, Computer Vision, Real-Time Systems
